Project summary
Application ID: synthetic-001
Access mode: Fast Lane
Target machine: LUMI-G
Project duration (months): 2
Organization type: University
Country: Finland
VAT number: FI12345678
Resources
Requested GPU hours: 50000
Maximum number of GPUs: 64
Total storage (GB): 1000
Total transfer (GB): 200
Personal data declared: No
Previous LUMI use: No
Previous EuroHPC allocation: No
Code details and feasibility
Code(s) used: PyTorch
Frameworks: PyTorch
Backend: ROCm
PyTorch supports ROCm; our core code targets AMD GPUs on LUMI-G.
No prior installation on LUMI. Custom environment installation is needed.
Workplan
We will run 50 training experiments, benchmark throughput and use independent concurrent jobs.
Scalability and performance
Independent job arrays use up to 64 GPUs. Each training experiment uses one GPU.
